

Per-call phase costs: first draft, steady draft, verify and native AR

- First draft
- Draft logits
- Target verify
- Native AR step
- Steady draft

Perf intervals in ms / call; first draft occurs once after TTFT. Steady draft repeats verify_steps – 1 times.
Draft logits mean is total logits time / verify steps and includes target LM head plus transfers and argmax.
Request totals / shares are in phase_latency figures: a large first call need not dominate a 256-token request.
