

qwen3.5-9b: what lives at every phase, at every context

DFlash: components probed at the close of each phase's largest occurrence; black line = interval peak (GB).
Pale band = peak minus probed components, including temporary or already released storage; not pure activation.
Phases are an envelope, not one chronological iteration. D1s is shown beside D1 for first/steady comparison.
Native AR has no phase-memory probes; right column is whole-run sums of device maxima, not a phase split.
